

A forest plot showing the effect of Z on the probability of being in the 'No' category. The x-axis is labeled 'Effect (Z)' and ranges from -0.1 to 0.1, with a solid vertical line at 0.0 and dashed vertical lines at -0.1 and 0.1. There are 11 data points represented by black dots. The first 6 points are clustered around 0.0, with the top point slightly above 0.0 and the bottom point slightly below 0.0. The remaining 5 points are clustered around 0.05, with the top point slightly above 0.05 and the bottom point slightly below 0.05.

A forest plot showing the effect size for the proportion difference. The x-axis is labeled "Effect (proportion difference)" and ranges from -0.25 to 0.25. A solid vertical line is at 0.00. Two dashed vertical lines are at -0.25 and 0.25. A single point estimate is shown as a black circle at approximately -0.05, with a horizontal line indicating the confidence interval.

Effect (correlation)
